

The Ins and Outs of Medial Patellar Luxation

Tige Witsberger, DVM, DACVS
September 23, 2016

www.Mission.Vet

Patellar Luxation

- Very common cause of hind limb lameness
- Developmental or Traumatic
- Medial (80-90%) or Lateral
- Dogs of any size
 - Small breed - MPL
 - Large breed - MPL too!
 - 17-33% LPL

Copyright © 2016 Mission Veterinary Specialists. All rights reserved.

Patellar Luxation

- 50-65% of cases are bilateral
- Breed disposition for Pomeranian, Chihuahua, Miniature Poodle, and Yorkshire Terrier
- History of (progressive) 'skipping' lameness - frequency increases over weeks to months

Copyright © 2016 Mission Veterinary Specialists. All rights reserved.

Limping

Copyright © 2016 Mission Veterinary Specialists. All rights reserved.

Patellar Luxation Pathogenesis

- Pelvic limb malalignment
- Coxo vara (decreased angle of inclination of femoral neck)
- Quadriceps muscle malalignment
- Internal rotation of the tibia
- Poorly developed femoral trochlear groove

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Grade 1

- Patella usually **IN** but can be moved **OUT** with force
- Usually incidental finding; non-clinical

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Grade 2

- Patella usually **IN** but moves **OUT** with activity/manually
- Intermittent “skipping” lameness when patella luxates
- May progress to grade 3 luxation with trochlear wear

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Grade 3

- Patella is usually **OUT** but can be manually reduced **IN**
- Often associated with bony abnormalities
 - Internal rotation of tibia
 - Curve of distal femur
- Bow-legged gait
- Lameness may be non-existent to severe

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Grade 4

- Patella **OUT** and cannot be manually reduced
- stays **OUT**
- Significant bony abnormalities; femoral varus
- Possible crab-like posture and gait
- May become non weight-bearing (CrCL tear?)

Physical Exam

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Physical Exam

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Physical Exam

- Intermittent/Skipping lameness
- Flex and Extend knee ==> In **full extension** push patella medially (and laterally)
- Patella luxates at **extension**
- Feel for femoral trochlea
- Evaluate CrCL (w/patella in)
 - Acute lameness?

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

When To Do Surgery?

==> Decision based on Grade and Lameness Severity

- **If lame, consider sx; if not, monitor patient**
- All MPL has potential to cause DJD but important to treat lameness and not disease (exception for CrCL tear)
 - Grade 2 MPL could be severely lame while Grade 4 MPL may show no lameness
- If acute lameness in long standing MPL - think CrCL tear

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

When To Do Surgery?

General Guidelines:

- **Grade 1:** Conservative
- **Grades 2 and 3**
 - Sx if:
 - Lameness occurs more than 3-4x/week
 - If younger —> to protect the CrCL
- **Grade 4:** Often surgical but some small breeds are not lame esp if older

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Surgical Goals

- 1) Retain patella in trochlear groove
- 2) Align quadriceps mechanism
- 3) 'Protect' CrCL from additional strain
- 4) Slow (or stop) progression of OA

Copyright © 2018 Mission Veterinary Specialists. All rights reserved.

Surgical Treatment Options

A) Soft Tissue Procedures

- Imbrication (lateral) and Release (medial)

B) Trochleoplasty

- Wedge and Block

C) Tibial tuberosity transposition (TTT)

D) Anti-rotational suture in parapatellar fascia or extra-capsular suture or Patellar Sling

E) Corrective osteotomies of femur (Grade 4)

Positioning and Draping

Copyright © 2018 Mission Veterinary Specialists. All rights reserved.

Draping In

Soft Tissue Procedures

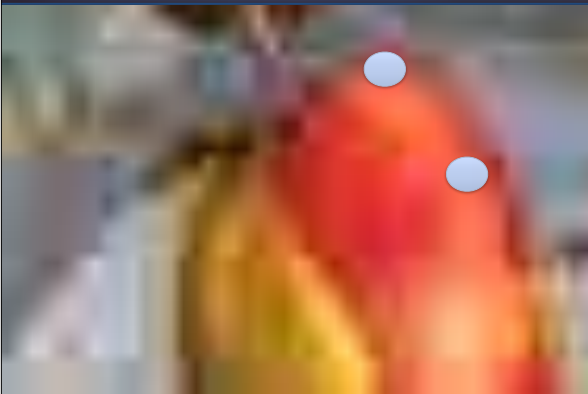

- Done on ALL patellar luxation cases!
- (Medial) Release
- (Lateral) Imbrication
- Goal: Help retain patella in trochlear groove

Soft Tissue Procedures

Soft Tissue Procedures

Soft Tissue Procedures

Soft Tissue Procedures

Medial Imbrication - Excess joint capsule

- Often very thick
- Remove small amounts - careful not to take too much!

Copyright © 2014 Motion Monitoring Systems. All rights reserved.

Capsular Imbrication

Capsular Imbrication

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Examining Joint and Cruciates

Up to 41% of dogs with MPL have CrCL tears; more likely with grade 4 MPL

Femoral Trochlear Groove

- Trochleoplasty almost always needed

courtesy ACVS

courtesy ACVS

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Trochleoplasty

- 4 Trochleoplasty techniques
 - Chondroplasty (very young dogs only)
 - Abrasion (not recommended)
 - Wedge recession
 - Block recession
- Goal: Deepen the groove with minimal articular cartilage damage

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Chondroplasty - Young dogs only

Copyright © 2018 Mission Veterinary Specialists. All rights reserved.

Abrasion Trochleoplasty

Courtesy Fossum

- Traumatic → Removes hyaline cartilage
- Heals with fibrocartilage → causes significant DJD
- Not recommended

Copyright © 2018 Mission Veterinary Specialists. All rights reserved.

Wedge Recession Trochleoplasty

- Remove wedge of articular cartilage and subchondral bone
- Deepen trough
- Replace wedge → Press fit
- Careful of Caudal Cruciate Ligament
- My preference in small dogs (<10kgs)

Courtesy Fossum

Wedge Recession

Courtesy Dr. Fred Pike, DACVS

Copyright © 2018 Mission Veterinary Specialists. All rights reserved.

Block Vs. Wedge Trochleoplasty

- **BLOCK IS BETTER**
- Increases proximal patellar depth - Better at preventing luxation at extension
- Preserves a greater amount of trochlear cartilage

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Block Recession Trochleoplasty

Tibial Tuberosity Transposition

- Goal is to align quadriceps mechanism
- Tuberosity laterally displaced (MPL)

Copyright © 2018 Mission Veterinary Specialists. All rights reserved.

When to do a TTT?

- After trochleoplasty is performed, reduce patella and put stifle through ROM - also evaluate the alignment of patella, tendon and distal limb

Copyright © 2018 Mission Veterinary Specialists. All rights reserved.

When to do a TTT?

Copyright © 2016 Mission Veterinary Specialists. All rights reserved.

Tibial Tuberosity Transposition

- Incomplete osteotomy is ideal but completion of bone cut is sometimes needed
- Osteotomy can be made with osteotome and mallet or bone cutters

Copyright © 2016 Mission Veterinary Specialists. All rights reserved.

Tibial Tuberosity Transposition

- Leave large enough segment to reattach with pin(s) and/or screw

Copyright © 2016 Mission Veterinary Specialists. All rights reserved.

TTT

Copyright © 2016 Mission Veterinary Specialists. All rights reserved.

TTT

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

TTT

- Tension band - if fractured through cortex/ completed osteotomy or worried about excessive stress on patellar ligament (i.e. noncompliance)

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

When to do a TTT?

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Tibial Tuberosity Transposition

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Anti-rotational Suture

- Sometimes TTT isn't enough or CrCL tear is present

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Lateral Reticular Reinforcement

- Around lateral labella to parapatellar fibrocartilage

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Patellar Sling

- Arthrex FasTak or
- Corkscrew; Fiberwire

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Patellar Sling

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Post-operative Care

- NSAID +/- tramadol for 7-10 days
 - Methadone, hydromorphone IV post-op
- Glucosamine + chondroitin (Dasuquin)
- Fatty Acids - fish oil
- Bandage?

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Post-operative Care

- 6-8 weeks of cage/pen confinement
 - 5-10 minute increments, focus on slow pace
 - Swimming, UW treadmill after skin heals
- Passive range of motion (PROM) exercises
- Gradual return to full activity after 6-8 weeks
- Pin removal?

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Grade 4 Luxation Repair

- More complicated
- Femoral varus often a component

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Grade 4 Luxation Repair

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Grade 4 Luxation Repair

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Patella Alta

- Normal PTL:P ratio - 1.5 to 2.0
- Patella alta - too proximal
 - PTL:P ratio >2
- (Patella baja - PTL:P ratio <1.5)

Copyright © 2014 Mission Veterinary Specialists. All rights reserved.

Patella Alta

Patella Alta - Post-op

2 week Post-op

Outcome Data

- Grade 2-3 MPL have very good prognosis
 - Relaxation - 8% (*Vet Surg 2006*)
 - Major Complications - 18% (revision sx)
 - Relaxation
 - TTT fracture, lateral luxation, infection
- Grade 4 luxation has more guarded prognosis (60-80% success rate)

Methods to Improve Outcome

- Dogs with Trochleoplasty AND Tibial Tuberosity Transposition have lower risk of relaxation (*Vet Surg 2006*)
- Ensure imbrication of joint capsule and not just fascia
- Confinement and rehab/PROM
